

Designing Reference Workflow

Is it possible to design a Reference workflow in Joget WITHOUT any technical intervention - by business users on their own. For e.g.

- Looking at the availability leave calendar of the team, auto assign tasks - review based on the set rules. For e.g if there are 5 people in the team. The workflow must refer the leave calendar and by default assign the person who is not on leave, who is not assigned any other previous Task or who is assigned less number of tasks as compared to the other members of the team. After all this rules, the workflow should automatically pick up the name of the person and reflect under the field "assigned to" in the form
- Based on the standard information captured in the form, refer to the estimation table and auto generate the corresponding values in the designated field in the same/ next form. For e.g if the development Task is of Medium complexity then the workflow must pick up from the estimation matrix the efforts registered for this complexity and display in the form.
- Escalation at multiple levels and notifications based on the set rules .
