

Assigning the same task to multiple users

Hello,

I have a case where I want to enable the user to assign the same task to multiple users so that each one of them will take an action on it, for example, a supervisor receives a request to maintain multiple PCs, then the supervisor wants technician A , B , C where those technicians belong to a group called "Technicians". currently the supervisor is able to select a single user and complete the task, after that it will be assigned to that single user, I want him to select multiple users and then the task will be sent to each one of them to be closed.

Thanks
