

How to use the JSON tool plugin in case the JSON URL will return multiple rows of JSON data

I have successfully used the JSON tool plugin in a web service that returns a single row such as :-

```
{
  "activityId": "1079_563_crm_process1_approve_proposal",
  "assignment": "admin",
  "nextActivityId": "1093_563_crm_process1_send_proposal",
  "processId": "563_crm_process1",
  "status": "completed"
}
```

but now I need to call web services that return multiple rows of JSON data, but how I should configure the JSON tool plugin in case the returned JSON will have multiple rows, such as :-

```
{
  "data":
  [
    { "id": "3724_mdec_v1002_mdec_wpl", "serviceLevelMonitor": "<span class=\"dot_red\"></span>", "name": "mdec_wpl", "state": "open.running", "due": "Fri Mar 20 14:01:27 SGT 2009", "startedTime": "Fri Mar 20 13:51:27 SGT 2009", "version": "2" }
    ,
    { "id": "3725_mdec_v1002_mdec_wpl", "serviceLevelMonitor": "<span class=\"dot_red\"></span>", "name": "mdec_wpl", "state": "open.running", "due": "Fri Mar 20 14:03:16 SGT 2009", "startedTime": "Fri Mar 20 13:53:16 SGT 2009", "version": "2" }
  ]
}
```

Is there a way for example to define a loop inside the JSON tool plugin or something similar to?

Best Regards
