

# Different JSON format is being returned depending on the number of processes under the packageId

i have note what seems to be an error in the

```
web/json/workflow/process/list&packageId=
```

JSON API, the problem is a follow:-

1. if the package contains more than one process (two processes in this me case) then the JSON result will be as follow:-

```
{ "total":2, "data": [{ "id": "leaveApp#2#leaveApplicationProcess", "packageName": "Leave App", "name": "Leave Application Process", "packageId": "leaveApp", "label": "Leave Application Process ver 2", "version": "2" }, { "id": "leaveApp#2#process1", "packageName": "Leave App", "name": "Leave Application Process2", "packageId": "leaveApp", "label": "Leave Application Process2 ver 2", "version": "2" } ] }
```

and i am being able to display the two processes using the following javascript:-

```
$(document).ready(function () {  
  
    $.ajax({  
        type: "GET",  
        url: "http://localhost:8080/jw/web/json/workflow/process/list?  
j_username=kermit&hash=9449B5ABCFA9AFDA36B801351ED3DF66&loginAs=admin&packageId=leaveApp",  
  
        dataType: "JSONP",  
  
        success: function (result) {  
            $.each(result.data, function (key, val) {  
                var str = val.name + ' | Version ' + val.version;  
                $('<li/>', { text: str })  
                .appendTo($('#products'));  
            });  
        };  
    });  
});
```

While if the packageid contain only one process then the above Java script will return "undefined" for the JSON, since i think because there will be no data property and the returned JSON format will be as follow:-

```
{ "total":1, "data": { "id": "crm#1#process1", "packageName": "CRM", "name": "Proposal Approval Process", "packageId": "crm", "label": "Proposal Approval Process ver 1", "version": "1" } }.
```

So can anyone help me on how i can make my javascript works regardless of the number of processes OR this is a problem in the API itself?

Best Regards
